

# Power Assist For Your Dialysis, Endoscopy, Radiology & Sonography Equipment

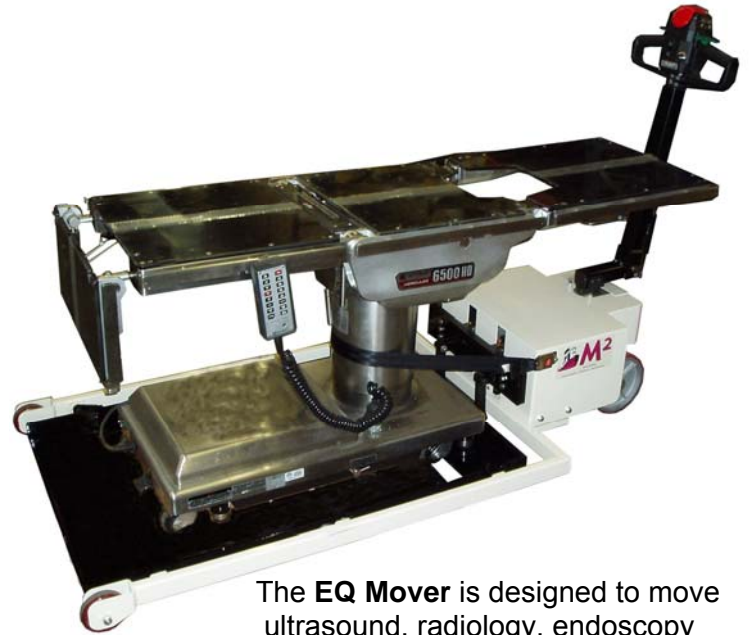

The same engineered ERGOtug to move standard hospital beds and stretchers has been modified to move all types of healthcare equipment.

Yet another solution to reduce the risk and cost of employee injuries, while increasing productivity and staff morale.

Like all ERGOtug machines, this model eliminates stress on the arms, back, shoulders and wrists.

The EQ Mover operates forward and reverse, is highly maneuverable and easy to use.

The **EQ Mover** is designed to move ultrasound, radiology, endoscopy and dialysis equipment; surgical tables (shown above); and patient recliners. This is a Medical Mover model, equipped with a platform that rises about 2" off the floor. Equipment is rolled onto the platform, strapped in, and then lifted for transport to its desired destination.

**800-800-9274**

The EQ Mover is the ideal power assist device for ultrasound equipment. Shown here with ATL's HDI 5000 model.
